

Household Products Public Education II

By: Ashley Hook-Rohland

Completed for:

Cate Henderson & Paula Anderson at Peterborough Green-up
Supervisor: Alan Brunger, Trent University
Trent Centre for Community-based Education

Department: Geography
Course Code: GEOG 470
Term: Fall/Winter, 2007-2008
Date of Project Submission: April, 2008

Project ID: 885

Call Number:

i. Acknowledgements

I would like to gratefully acknowledge the contributions of my professors Dr. Alan Brunger and Dr. Mark Skinner for graciously providing their time, expertise, and efforts in assisting in the development of this research report and for their ongoing academic support.

Much gratitude is also owed to Adam Guzkowski of the Trent Centre for Community-Based Education for his patience in answering my numerous questions and for being consistently available for group meetings and presentations. The TCCBE has provided me with the opportunity to make valuable connections within the community and has given me the unique opportunity to work closely with a community group in hopes of providing the community with valuable information that they otherwise may not have known.

I have to acknowledge what a pleasure it has been to work with the staff at Peterborough Green-Up. Cate Henderson and Paula Anderson have been extremely helpful and knowledgeable, and have really given me an opportunity to help the community as a community member by not giving me a strict mandate and just being supportive in whatever direction I decide to go. The opportunity to work with Peterborough Green-Up has encouraged me to live a more environmentally sustainable lifestyle and has demonstrated the complexities that can sometimes be involved with public education.

I need to thank the staff at JoAnne's Place and The Main Ingredient in Peterborough for graciously helping me sort through my long list of products and ultimately helping me to provide the information to the public.

Finally, I need to acknowledge my family, friends, colleagues and mentors for tolerating me this last year, despite my numerous tribulations.

ii. Abstract

The purpose of this report is to continue needed research on the human and environmental affects of common household products. Peterborough Green-Up will use the information to continue the Green Shopping Guide, a database of suggestions for local consumers to use when shopping for environmentally sustainable or healthier choices. Looking at specific types of personal care products, this paper determines possible alternatives to harmful products or ingredients (or personal care pollutants, as some call it) that are available in the County and City of Peterborough area. Using stores and other purchasing outlets central to my geographical location in downtown Peterborough, I demonstrate the notion of shopping as close to home as possible. The method I used to determine the less toxic products was to gather information about less toxic products from cosmeticdatabase.com, a reliable database of products and ingredients that is cross-referenced across 50 toxicity databases around the world (The Campaign for Safe Cosmetics). Using the list, I surveyed stores that are in close proximity to my home, and I recorded the price and size of each product that the store had that was on the list. I combined this method with a search on the internet and in academic journals to find suggestions for ingredients that consumers should try to avoid. Based off of these two methodologies and literature I read, I made recommendations to be used as tools in the public education process.

This information is critical for a large variety of people, from people who want clean water and air, to people seeking a healthier lifestyle, to people who suffer from allergies and all of the people associated with those people. I make recommendations about where to buy products, what products to buy, what ingredients to avoid, and other suggestions about proper disposal and other shopping considerations that one should make. I also review literature about the human and environmental affects of PCPs and discuss literature on production and disposal of solid waste and geographical issues such as global environmental politics, Canada's green initiatives, the impact of Wal-Mart, and consumerism.

I critically review my methodology and reflect on any flaws that may exist in the research. I also point out that despite any flaws, my research is an important contribution to the growing amount of literature available on the topic and I recommend that further research needs to be done in the field to better educate the global public and to make any sort of advancement in the regulation of toxic personal care pollutants.

1.0 Chapter One - Introduction

From the moment each of us wake up every morning we begin our harmful routine of polluting the environment with the many things that we ingest and apply to our bodies. From our morning coffee, to our daily dose of prescription medicine to the shampoo we put on our heads, and to the water we use to eventually dispose of it all, we are dumping masses of chemicals into our environment. The main goal of this project is to continue needed research on the human and environmental effects of common household products. This specific report is a branch of the main project and deals with identifying products or ingredients in personal care products, or as Nikki Stiles prefers, "personal care pollutants" (Stiles, 2004, 14) that the community of Peterborough County and the City of Peterborough should try to avoid purchasing for environmental and personal reasons. As I have found throughout the research process, and as you will throughout this report, many researchers group the environmental effects of personal care products, or pollutants, with pharmaceuticals to create the mega group they call PPCPs (Pharmaceuticals and Personal Care Pollutants). From the research gathered from various sources including academic journals and the internet, a list has been assembled of locally accessible products that would pose as a reasonable alternative to the products found to be less safe, both for the environment and for the individual.

In addition to the list of suggested products consumers should buy in the local area, there is discussion about the main ingredients to try to avoid when purchasing personal care products paired with toxicological data demonstrating various proven and suspected effects of certain chemicals on the environment and humans. Ultimately, this paper deals with the same notion that so many papers in the field also deal with, which is that much of the theory around personal care products (PCPs) is not proven and is only in the preliminary stages of discovery. However, despite this, it is important to consider that the very suspicion of a toxic substance should warrant its avoidance.

The original questions do not require conclusive evidence. The questions are very carefully posed to allow for a variety of directions and reflections and so, have necessitated a variety of answers and questions to follow. The original research questions are as follows:

1. Which commonly available products or ingredients in products being studied could be hazardous to environmental or human health?

2. What data are available with regard to proven harmful affects on the environment or humans?
3. Are there products produced locally that could be substituted for harmful products? If not, where are alternatives produced?
4. What should consumers consider with regard to purchasing personal health products?
5. Where and how should harmful products be best disposed of to minimize the risk to humans and the environment?
6. What geographical issues are involved in this topic?

The first five of these questions were posed by Peterborough Green-Up, a non-profit organization whose aim is to enhance the environmental health of Peterborough County and the City of Peterborough. Their primary areas of concern are waste reduction, water quality, water conservation, energy conservation, landscape enhancement, air quality improvement, active and alternative transportation and climate change awareness. They require parts of this report to support their ongoing development of the Green Shopping Guide, which can be found on the Peterborough Reuses website (www.peterboroughreuses.com/shopping/), another website maintained by Peterborough Green-Up.

The last question is complex and adds another dimension to the considerations one should make in regards to purchasing personal care products. The geographical aspects of this topic are quite relevant at all global political levels, and like the topic of suggesting 'good' products, are highly complicated, and deserve separate papers devoted to each aspect. There is a movement among politicians at all levels of government to incorporate environmental plans into their platform. This topic has impacted global relations and has divided allies in some cases. This topic divides towns and causes problems between small town business and large corporate competition. All of these political aspects will be described in detail and in relation to global economics and the geography of consumerism.

By the end of this report, the reader will be better acquainted with potentially toxic substances that could be lurking in the products they use everyday. They will become educated about alternatives to these toxic products and where they can be found locally. And they will learn proper disposal methods and points to consider when purchasing a product to hopefully reduce or eliminate any part of the product that needs to be disposed of. In the end,

a focus on Peterborough Green-Ups notion of the five R's (Rethink, Refuse, Reduce, Reuse, Recycle) will be recommended as there is no one right product to purchase all of the time and it is ultimately up to the consumer to decide what product is best for their situation, taking some provided guidelines into consideration.

2.0 Chapter Two - Theories, Models, and Hypotheses

I originally believed my research would determine that all store-bought products are toxic for either humans or the environment. I have done previous research into the effects of chemicals that are put down the drain, knew that water treatment facilities can only extract what they suspect could be in the water, and realized the potential hazard of having such an array of chemicals available for disposal down our drains and into our water system. Therefore, my original emphasis was on homemade remedies. Since then, my direction has shifted as the research questions asked about 'products' that can be found locally, and so I decided that there had to be an element of my research that exposed something unique to Peterborough. I decided to then focus on local stores like Shoppers Drug Mart, Wal-Mart, and JoAnne's Place among others. I suspected that Joanne's Place would be the obvious place to buy less toxic products because it seemed to me that people who choose to live a more sustainable lifestyle tend to shop there. It was also my grossly uninformed opinion that this research would only benefit new age environmentalists, or the so-called 'hippie' type. Judging by the reactions I have received from peers and other community members, I am under the impression that my original feelings are not unique. And this has helped me to understand and appreciate the importance of the 'public education' aspect of this research.

3.0 Chapter Three - Review of the Literature

There is a breadth of information available on this topic. However, it is complicated because so much of it is controversial or circumstantial and all of it is inconclusive. There are also many aspects to this topic and I have tried to touch on as many as possible in the time allotted. Most of the information is also redundant and if one is lucky enough to find new support; it is often easily conflicted by a previous article. At this time, I will divide the contents of this topic into four different aspects.

3.1 Environmental

Recent news has highlighted the fact that pharmaceuticals have been found in Southern Ontario's drinking water ("Pain Killers, other Drugs Found in Southern Ontario Drinking Water"). This study and studies like it, parallel the effects of personal care pollutants on water. There is a large sum of literature about the various chemicals found in our drinking water and sewage that can be linked to certain personal care products. Chemicals that appear frequently in this topic are musk fragrances and triclosan. Triclosan is an antiseptic agent that is found in a surprising amount of shampoos, soaps, moisturizers, toothpaste, and many other everyday product types. According to the European Union – Classification & Labeling, triclosan is dangerous to the environment and very toxic to aquatic species ([Skin Deep: Cosmetic Safety Database](#)). In *Occurrence and Reductions of Pharmaceuticals and Personal Care Products and Estrogens by Municipal Wastewater Treatment Plants in Ontario, Canada* five polycyclic musks and triclosan, among others, were investigated and it was found that there are trace amounts of these chemicals entering Canadian waterways and that only some of the chemicals were being significantly reduced in municipal water treatment facilities (Lishman et al., 2006).

Although most of literature that I found seems to be about water pollution, there is also a very significant amount on the effects of personal care pollutants on aquatic species. As an example, Wilson et al. and Ishibashi et al. discuss its effects on freshwater algae and medaka, respectively. Stiles briefly discusses the work of Dr. Chris Metcalf at Trent University as a leading Canadian researcher in the field of the effects of PPCPs on aquatic species, specifically fish in the Great Lakes (Stiles, 2004, 15). In a recent issue of the *Peterborough Examiner*, Trent Rhode of Peterborough Green-Up writes about studies Dr. Metcalf has done in local waters and suggests the probabilities of small quantities of PPCPs in our drinking water (Rhode, 2008).

Dr. Metcalf notes that although the quantities are small, they should not be ignored and Peterborough should be looking into water treatment systems similar to those in Europe to reduce the effects (Rhode, 2008). He also stresses the importance of decreasing the amount of contaminants that we put into the water in the first place, echoing the goals of this research (Rhode, 2008). I would like to suggest Dr. Chris Metcalf as a source for any further research in this area, specifically in regards to the effects on aquatic species as he has many published pieces on the topic.

And finally, but certainly not lastly are the effects of PCPs on air pollution. Again, in *Synthetic Musk Fragrances in Urban and Rural air of Iowa and the Great Lakes*, the impact of musk fragrances is mentioned (Peck and Hornbuckle, 2006). I mention this not to insist that musk, and triclosan, are the only harmful chemicals released into the environment, but rather to demonstrate how the impact can be seen at all levels of environmental pollution and therefore having a greater overall impact on our quality of life.

3.2 Human

For the most part, I have focused on literature about the toxicological affects of PCPs on humans - and there is a lot of it. In chapter six I will summarize the contents of the literature and data that I have found in terms of recommended ingredients to avoid and why. For now, I would like to stress the recurring point that more data are needed properly assess the issue. This is brought up throughout numerous articles on toxicology. Trent University has access to a few academic journals devoted entirely to the topic of toxicology and in them are many, sometimes conflicting, articles about numerous ingredients available in PCPs. One example of this contradiction is the opinions surrounding parabens. Parabens are cited in numerous pieces usually as potential carcinogens, mainly associated with breast cancer and they can also be skin irritants. In "Safety assessment of esters of p-hydroxybenzoic acid (parabens)" the argument is made that the paraben structure is not indicative of a carcinogenic and claims that there are studies to show it (Soni, M.G., I.G. Carabin and G.A. Burdock, 2005). Meanwhile, companies such as Burt's Bees are making claims that their products are "paraben free" and there are multiple articles which support reasons why that would be a good thing. After reading literature on this topic, it seems to me that a lot of the confusion may exist because of the many forms that parabens can take. Some claims might be referring to a specific type of paraben. Either way, it all comes down to a lack of conclusive evidence and again suggests

that maybe one should avoid the use of them, just in case. And again, parabens are just an example of the many controversial ingredients. Many well-sourced websites include some rigorous literature about tens of thousands of ingredients that are registered for use in cosmetics, among the best I have found are www.cosmeticdatabase.com and the Cosmetic Ingredient Review, www.cir-safety.org.

There are other human aspects of this topic that I decided not to spend a lot of time on, but did find some literature. This is the idea of moral values such as animal testing and free trade. These are relevant topics that I think should be investigated in the future.

3.3 Packaging

This category includes the production and disposal methods of the various types of packaging. There did not seem to be as much literature on this topic as some of the previous ones, however, I did find some valuable sources. The best local source is the City of Peterborough Waste Management, Division. I used their website to determine the product types that are recyclable locally. One point that many pieces have pointed out is the importance of knowing what is recyclable in your local area, otherwise any sort of product labeling means nothing. One thing that I could not determine from the website is what actually happens to the products we turn in for recycling and whether they relocate our waste to another facility. Bluewater Recycling Association gives this sort of information to its citizens ([Blue Water: Your Environmental Alternative](#)). Websites like this may offer potentially valuable information to Peterborough consumers as it may help encourage the use of one type of packaging over another for environmental reasons. I have not found any of the information provided on any of the websites particularly swaying, as it seems every type of packaging has a down side and it becomes a matter of choosing the lesser of two evils. Websites that describe the process involved in making each of the types of packaging is useful for determining this. Two students from Lawrence University prepared a webpage describing the various processes of paper and plastic production and the lifecycle of each type (Decker R. and Graff A). Multiple sites like this give some impression of the impact. However, I did not find anything published in an academic journal that provided this sort of information.

I did find a lot of information about recycling symbols. I thought that this would be hugely important in ultimately recommending safer products, however, Peterborough seems

to have no restrictions on certain types of plastics, so it was not as useful as originally hoped. I suppose the most important symbol I learned about is the percentage sign inside the standard mobius symbol (Figure 3.1). This lets the consumer know how much of the packaging is made from recycled materials and this would be one way to ensure slightly less environmentally harmful packaging.

Figure 3.1 *Post-consumer recycled material symbol*
Percentage number in the centre represents the amount that it contains.

I also found the Statistics Canada report Overview of Packaging Products Used by Canadian Manufacturing Industries. This report was insightful as it helped me conceptualize the magnitude of packaging this industry is responsible for. The report also discussed the various increases and decreases in sales and production over the years and indicated that the most driving factor among increases was consumer demand. Statistics Canada also points out that one reason that corrugated cardboard is more popular is because it is made from a renewable resource.

CANADA	Plastic containers and Packaging	Corrugated boxes	Metal Cans	Folding and set-up boxes	Glass containers	Other	Total
Millions of Dollars							
Food industries	756.9	546.4	358.4	374.3	111.9	540.1	2,688.0
Beverage industries	204.9	168.1	506.8	67.9	160.2	233.1	1,341.0
Paper and allied products industries	47.3	91.6	x	x	-	356.7	572.0
Tobacco products industries	23.2	13.1	x	80.2	-	x	156.0
Plastic Products Industries	18.1	89.1	x	28.9	-	x	195.0
Wood Industries	25.8	12.7	-	1.3	-	138.2	178.0
Electrical and electronic products industries	2.9	56.8	-	59.7	-	48.6	168.0
Non-metallic mineral products industries	20.5	50.7	1.1	5.7	-	62.0	140.0
Fabricated metal products industries	3.0	49.9	x	10.2	-	x	134.0
Transportation Equipment Industries	0.6	65.5	x	x	-	56.7	139.0
Other	78.7	226.2	12.3	83.0	-	236.8	637.0
Total	1,414.1	1534.5	979.8	861.4	348.2	2,088.0	7,226.0

Table 3.1 *Consumption of Containers by Industry Group and Type of Container, 1996*. Statistics Canada. This table demonstrates that the chemical and chemical products industry uses the third largest amount of plastic containers and plastic packaging, and third overall user of all forms of packaging combined. The containers used to hold personal care products fall into this category.

3.4 Geographical

3.4.i Global Environmental Politics

Geography can be linked to this topic mostly through environmental initiatives. I will begin by discussing the literature I have found concerning global political environmental initiatives and eventually bring you to literature about more localized environmental initiatives. In Bernstein's article "Globalization and the Requirements of "Good" Environmental Governance," he argues that globalization has shifted the role that ethics plays in environmental governance. He also mentions the role of authority in environmental governance and declares that a weakness of global governance is the dilemma of how to strengthen the initiatives without losing major contenders, such as the United States pulling out of the Kyoto Protocol (Bernstein, 2005, 19). Bernstein's lengthy article encompasses everything I was thinking of in regards to global environmentalism and more. As soon as one broadens their search to global environmentalism, a wealth of information relating to geography becomes available.

Another interesting concept that I came across in the readings is the idea of international toxic waste dumping. In Jennifer Clapp's article "The Toxic Waste Trade with Less-Industrialized Countries: Economic Linkages and Political Alliances", she describes what was happening in the early nineties where western countries were paying third world countries to dump their toxic waste there (Clapp, 1994). In the article, she demonstrates two key aspects of global environmentalism. One is the inevitable link between world economy and global environment and the other is the role played by non-state representatives such as NGO's. NGO's brought about a ban on waste-trading and highlighted the importance of such organizations in moving forth environmental initiatives. This article, and others like it, raises issues about the insecurity of our future if we do not learn to manage our waste. It also supports Bernstein's idea of ethical involvement in environmental sustainability.

3.4.ii Canada's Green Initiatives

The responsibility of Canada's green initiatives are scattered between all levels of government, NGO's and community members. In "Multi-Party Monitoring in Ontario:

Challenges and Emerging Solutions”, the authors describe how this has become a problem for Canada’s advancement in their green initiatives and offer recommendations on how to improve the situation (Milne R. et al., 2006). One challenge they describe is that there is no standard scientific method used across all ecosystems. Also, there are difficulties with network and capacity building. And finally, parties are unable to make any difference because there is no collaboration or linking of information in the decision making process. They make numerous recommendations, but the most interesting one I find is that programs need to be focused more on the ecological landscape. They give an example of focusing either on watershed ecosystems or landscapes. They support their recommendation by saying that many environmental management strategies already exist for these types of divisions and they give examples such as the Conservation Authorities, Ontario Green Belt, Oak Ridges Moraine, and the Niagara Escarpment. I found this article particularly interesting because I feel that perhaps Peterborough Green-Up could use some of these strategies to enhance their program.

Potential downsides to Canada’s initiatives are its political parties. In “Greening Politics”, Paehlke and Ross summarize the political achievements and goals of each of Canada’s political parties and give a really good sense of where Canada is going or potentially could go in the future in regards to environmental sustainability (Paehlke and Ross, 2007). They do not offer much of a discussion about each party, but instead offer the facts and point out any interesting notes along the way. Although this article describes each initiative the political leaders have, the message I get, really just reinforces the importance of the previous article I mentioned. It seems as though every time a political leader makes any sort of advancement, the next PM just comes in and demolishes it, or at least that is what has been happening recently. The article also highlighted the unique problems that Canada faces from a geographical standpoint. Prime Minister Harper’s ideas represent Alberta. The Federal Liberals try to be unbiased, but really only represent Ontario, and the Bloc Quebecois believe that they can solve Canada’s environmental crises by committing the province of Quebec to Kyoto and taking other environmental responsibilities within the province without considering the rest of Canada. So again, articles like these (without actually saying it) emphasize the importance of NGO’s and individuals, because without them, nothing else would get accomplished.

3.4.iii Wal-Mart World

There is no doubt that Wal-Mart has had a vast impact on the global economy and inadvertently is at the forefront of opposition from community members, storeowners, and environmental and social activists alike. Wal-Mart Watch is a website dedicated to keeping current information on everything to do with Wal-Mart. It offers an immense amount of interesting information regarding Wal-Mart's policies on environmental, labour, healthcare, discrimination, and political issues, and offers up-to-date news items. It is unbiased and presents information that both supports and opposes Wal-Mart. As an example of the type of information on the site, the Wal-Mart Watch website states that Wal-Mart hopes to cut 2.5 million metric tons of CO₂ emissions by 2013, by making its existing stores 20 percent more efficient. However, it has also added more stores, claiming that while Wal-Mart plans to decrease the amount of CO₂ emissions by 2.5 million tons, it is increasing it by 28 million metric tons (Wal-Mart Watch). The website also discusses the two "green stores" that Wal-Mart operates and the other handful that are "high-efficiency." The website claims that this is not enough considering they operate over 6000 stores. But I feel that it is a step in the right direction and "green movements" have only recently gained popularity. I am hoping it is only the beginning. I felt it was important to research this aspect because I had always believed that if Wal-Mart had any less toxic products, they would be the cheapest. This notion has led me to recommend Wal-Mart and I felt that it was essential that I have information available that shows that perhaps Wal-Mart is not *all* bad.

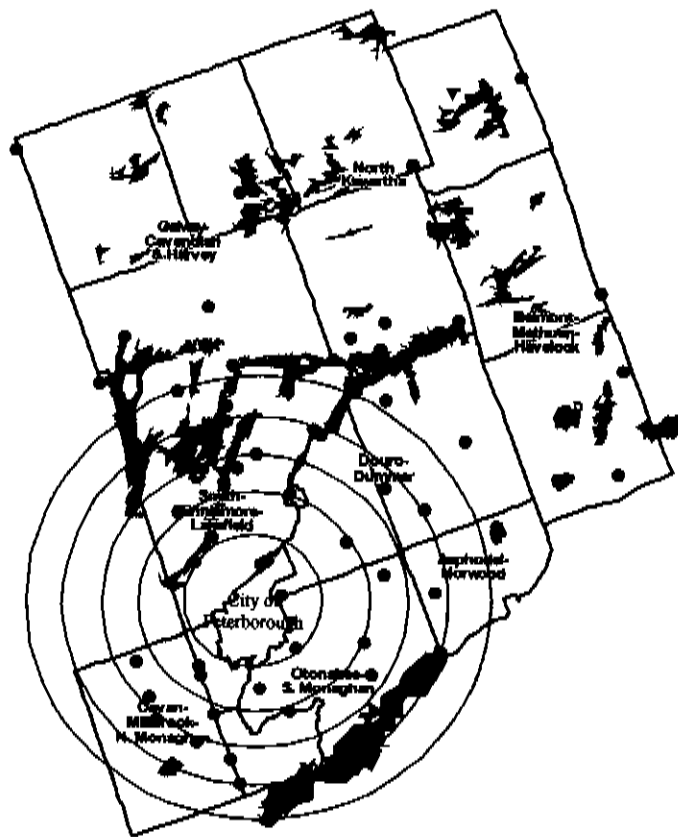

3.4.iv Consumerism

In "Ethical Consumers in Search of Markets," Wheale and Hinton attempt to discover what type of shopping ethical consumers prefer to do; environmental, human rights, or animal rights (Wheale and Hinton, 2007). Their study determines that overall, people tend to purchase ethically for environmental reasons, but they note that this changes depending on what category of products they are shopping for. It is important to understand the reasons behind consumers purchasing when doing studies like this. However, for the purposes of this study, I never differentiated between the three types of moral values and had always considered them to be linked.

Eriksson's article sought to determine whether there is any sort of factors that prevent people from buying green to establish whether green consumerism could replace the need for green regulations, which would be beneficial considering the negative impact of political shifting on environmental policy as described above (Eriksson, 2004). Eriksson is unable to determine the geographical distribution of consumers' willingness to pay an increased price for environmentally friendly products, but does admit that cost does factor into the success of green consumerism. Cost was not a factor for Peterborough Green-Up, but I included it in my analysis of products anyway.

4.0 Chapter Four - Study Area

This research makes frequent use of the idea of buying or producing locally. Specifically, Peterborough Green-Up describes the area that it includes as Peterborough and the Kawarthas, or as the Peterborough County and the City of Peterborough. With this definition goes the notion of the local area extending out in a concentric wave from where ever the consumer is located (as depicted in Map 4.1). In summary, buying local is buying products that are as close to a consumers geographical location as possible. Products in this research are specifically available to consumers like me who live in the downtown core.

Map 4.1 *Peterborough County and the City of Peterborough*. Peterborough Web GIS (2007)
The study area, includes the City of Peterborough and all of the other townships on the map, although all of the research was focused in the City of Peterborough. The red dots represent settlements.

5.0 Chapter 5

5.1 Methodology

I was given the opportunity to create my own methods to complete the task of finding less toxic products in the Peterborough County and City of Peterborough. To begin the task I needed to know what products were the most important to Peterborough Green-Up because I could not possibly research them all. So together with Peterborough Green-Up staff and Adam Guzkowski from the TCCBE, I produced a list of eighteen product types in order of importance to Peterborough Green-Up (Table 5.1).

Level of Importance	Product Type
1	Shampoo
2	Hair Dye
3	Deodorant
4	Soap
5	Hair Removal
6	Head Lice
7	Toothpaste
8	Contact Lens Solution
9	Acne
10	Other Hair Products
11	Nail Polish
12	Moisturizer
13	Chap stick
14	Makeup
15	Perfume
16	Bath Products
17	Teeth Whitening
18	Baby Products

Table 5.1 List of Products to be Studied
Products that are considered high priority to be studied by Peterborough Green-Up, Adam Guzkowski, and myself. (above)

Location: Shoppers Drug Mart (865 Chemong Rd., Peterborough)		Product Type: Shampoo

Plastics #2, LDPE	\$4.49 / 710mL SALE	No.	Large bottle.

Table 5.2 Sample of How Original Method would have been Executed
Meant for demonstration purposes only, this table illustrates the task of the original method. Fortunately, the Cosmetic Safety Database provides this information on their website, eliminating the need to stand in the stores and record it, then retype it at home. (above)

Using this list, I decided to focus on the first seven product given the limited amount of time. I devised a chart (seen in Table 5.2) to help me compare products. The goal was to go to a variety of types of stores and seek out at the most, five different brands of each of the first seven product types. Using the data in the charts, I would have found trends among the ingredients and focused on finding data about each of those reoccurring, or suspicious ingredients. However, due to my indisposition after an unexpected surgery, I was unable to visit the stores to fill in the charts and therefore had to come up with an alternative method of data collection.

The alternative method relied heavily on the Environmental Working Group's Skin Deep: Cosmetic Safety Database. This website provides almost exactly the same information as I needed for my previous methodology, except I did not experience any mobility issues and it provided a lot of references and links to other sources. Using the website, I searched for products in many of the categories listed in Table 5.1 and made a list of all of the products that the website considered to be 'low hazard'. Using the list, I went to a variety of local stores including Shopper's Drug Mart, Wal-Mart, The Main Ingredient, JoAnne's Place, and Price Chopper, to find out whether they carried any of the products on the list. I also recorded the price and size of any products that I found. I also visited the Peterborough and District Farmers' Market at the Memorial Centre to see whether any locally produced products are available.

This information provided me with the majority of my recommendations for Peterborough Green-Up. This alternative method also provided me with the opportunity to research more product types. I was now able to cover twenty-three different types. I essentially tried to cover all of the areas of concern, avoiding large categories such as baby products and makeup because it is my opinion that they should be treated separately. I had to divide some of the original categories as well, for instance, perfume into men and women's fragrances and body sprays because this is the labeling system that the cosmetic database used. The actual list that I studied as broken down by the cosmetic database can be seen in Table 5.3.

Shampoo	Shaving Cream (Women's)	Head Lice Removal	Hair Relaxer
Hair Dye	Shaving Cream (Men's)	Toothpaste	Nail Polish
Deodorant / Antiperspirant	Depilatory (Women's)	Contact Lens Solution	Moisturizer
Bar Soap	Depilatory (Men's)	Acne Treatments	Lip Balm
Body Wash	Hair Removal Waxes	Hairspray	Fragrance (Women's)
Teeth Whitening	Body Spray	Fragrance (Men's)	

Table 5.3 A list of the new categories of products as broken down by The Cosmetic Safety Database. This categories are listed in no particular order.

In addition to the list of products that can be found locally, I wanted to make a list of ingredients to try to avoid when purchasing products. My main source was the National Geographic's "The Dirty Dozen Chemicals in Cosmetics" (National Geographic). Their suggestions allowed me to look deeper into each of their recommendations and determine whether to add it to my recommendations. There are a number of cities and companies that have created a list of ingredients to avoid, and some of those suggestions have also been incorporated into my recommendations. That is how my recommendations based on human toxicity were developed.

For environmental toxicity, I tried to find information about how packaging is produced to help direct people towards one type of packaging over another. I also looked into recycling symbols and other symbols that are found on PCPs. I explored the various disposal methods available, which in the case of Peterborough, means the recycling facility. And I read reports about some environmental affects of certain ingredients on animal life and our physical environment.

I have summarized all of the results from these various actions in the recommendations section of this report for Peterborough Green-Up and others to use.

6.0 Chapter Six - Data and Results

The bulk of the research, other than the literature review, centered around going to stores and determining whether they carried any of the products on the list of low hazard products. It is important to note that the products that are on the list only address issues of human toxicity and unfortunately the packaging of each product is not considered. Another important note is that the list is not complete as there are of course products and versions of products that are not included on the Environmental Working Group's website. However, a good selection is represented as they have nearly 30,000 products represented on its site. Also, Table 6.1 is not complete either as, for instance, I noticed that between my visits to Shoppers Drug Mart they had restocked their shelves and may be carrying new lines of products. In this sense, the chart is never ending. It is something that needs continuous updating, which is impossible to do in the terms of a research project like this one.

6.1 Notes on Each Store

6.1.i Wal-Mart

1002 Chemong Rd., Peterborough, ON

The one thing I found particularly interesting about the layout of Wal-Mart is that all of the natural products are in their own (small) section off by the pharmacy, with a few exceptions that are scattered throughout various nutrition aisles. Also, many of the shelves looked fairly bare, so I would imagine that normally, they have a better selection than they did when I was there.

6.1.ii Shoppers Drug Mart

225 Charlotte St., Peterborough, ON

It was fairly easy to find the products on the shelves because Shoppers Drug Mart divides their store in very clear sections and does not have particular brands or types of products located in separate areas, with the exception of Burt's Bees products, in which case there is a separate display stand. I also noticed that the selection varies greatly by store and I know for a

Table 6.1 List of Less Toxic Products Available in Selected Stores in Peterborough

	Wal-Mart	Shoppers Drug Mart	Price Chopper	The Main Ingredient

fact that both the Chemong Rd and Lansdowne St. locations have a wider selection of products.

6.1.iii Price Chopper

181 Brock St., Peterborough, ON

Again, the particular store I selected was the smaller of the two in Peterborough and there is a (slightly) better selection of products at the Lansdowne location. However, it was important to me to choose the most central locations, as it demonstrates the concentric model of shopping described in chapter 4.

6.1.iv The Main Ingredient

326 Charlotte St., Peterborough, ON

The Main Ingredient has a very small selection of PCPs, and very few of them actually appeared on the list of less toxic products. However, the products that they do carry are natural products and many of them are the same brand name as many of the products on the list (ex// JASON, Kiss my Face).

6.1.v JoAnne's Place

904 Water St., Peterborough, ON

When I visited JoAnne's Place, I began to record which products they carry and the price and size of each product. After a short time a staff member approached me and showed me their ordering catalogue and explained to me that they can get in almost any of the products on the list, all you have to do is ask. They also had a very large selection of products already on their shelves. The prices are more expensive than department and drug stores, but if there is a specific product that you want, or you want the product listed as the less toxic, JoAnne's Place will more than likely have it.

6.1.vi Peterborough and District Farmers' Market

(Memorial Centre) 151 Lansdowne St. W., Peterborough, ON

The Farmers' Market did not have a huge selection of products available. However, they did have natural products made from emu oil or bees wax when I visited. These products not only had a small number of ingredients in them, they are locally produced and they benefit local farmers. The products also were not outrageously expensive, they let you try the products, and I think the products felt amazing. Of course the nature of a Farmers' Market is

that it is always changing and so these vendors may not always be there, or there may be a wider variety another day.

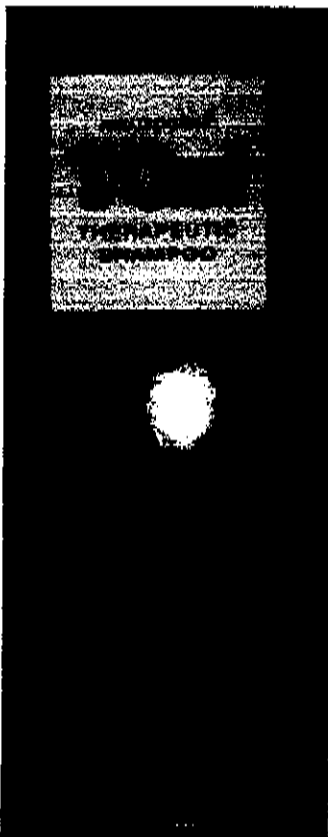

6.2 Ingredients to Avoid

6.2.i Antibacterials (triclosan, triclocarban)

Antibacterials, especially triclosan, have been showing up in our sewers (as previously mentioned) and in breast milk (National Geographic), among other things. Triclosan is widely used in soaps, toothpaste, and deodorant and studies are beginning to demonstrate that resistance to antibacterials is starting to be found in places where it is used on a frequent basis (hospitals and the food industry) (APUA). Antibacterials should only be used in areas where disease prevention is critical and should not replace routine hygiene (APUA).

6.2.ii Coal Tar Colours: FD&C Blue 1, Green 3

These are highly suspected to be carcinogens ([Skin Deep: Cosmetic Safety Database](#)). They are color additives in hair dyes and makeup ([Greener Choices](#)). Coal tar is a known carcinogenic and can be found in some shampoos, scalp and anti-itch treatments and a few other things ([Skin Deep: Cosmetic Safety Database](#)). One very common product it can be

found in is the Neutrogena T-Gel shampoos (Figure 6.1), which I have seen at Shoppers Drug Mart and Wal-Mart. Coal Tars, are also on *The Cosmetic Ingredient "Hotlist"* created by Health Canada as described in section 6.3.

Figure 6.1 An image of T/Gel by Neutrogena. Near the bottom of the carton under the word 'Neutrogena' you will see where it says it contains 0.5% Coal Tar. (left)

6.2.iii Diethanolamine (DEA)

DEA is a suspected carcinogenic used infrequently in foundation, sunscreen, body wash, mascara, and a couple of other things ([Greener Choices](#)). Cocamide DEA, MEA, and TEA, are used more commonly in PCPs and may be contaminated with DEA ([Greener Choices](#)) so beware of these ingredients as well.

6.2.iv 1,4-Dioxane

It is a known animal carcinogen and a suspected human carcinogen (National Geographic), that accumulates in body fat tissues (SISEL). 1,4-Dioxane is a chemical that does not tend to appear directly in a product's ingredient list, but instead appears in many products containing sodium laureth sulfate or under the terms as "PEG," "xynol," "cetareth," "oleth" and most other ethoxylated "eth" ingredients (National Geographic) and is an accidental byproduct impurity of the manufacturing process (Guide to Less Toxic Products). Plastic bottles may also seep this chemical into our shampoos and creams and other products that we use everyday (Guide to Less Toxic Products).

6.2.v Formaldehyde

Formaldehyde is a known human carcinogen, allergic sensitizer (Greener Choices), immune system toxin and respiratory irritant (National Geographic), and it is not banned from use by Health Canada. In its pure form, formaldehyde appears in such popular brands as OPI Nail Treatments and Perfectone Permanent Color Cream (in some of the darker shades) (Skin Deep: Cosmetic Safety Database). Even more unsettling, formaldehyde appears as an impurity in over 6,000 products on The Environmental Working Group's Skin Deep: Cosmetic Safety Database. According to the database, there are ten different ingredients which include formaldehyde as an impurity: diazolidinyl urea, DMDM hydantoin, imidazolidinyl urea, quaternium-15, sodium hydroxymethylglycinate, 2-bromo-2-nitropropane-1,3-diol, polyoxymethylene urea, methenamine, 5-bromo-5-nitro-1,3 dioxane, and glyoxal, and of course they all have a variety of other names that they can be listed under.

6.2.vi Fragrance

Synthetic fragrance is the most popular ingredient in PCPs (Guide to Less Toxic Products). It can cause headaches, dizziness, rashes, skin discoloration, violent coughing and vomiting, allergic skin irritation, and it can affect the central nervous system, causing depression, hyperactivity, irritability, inability to cope, and other behavioral changes (Guide to Less Toxic Products). It is also known to trigger asthma and many of the compounds are known or suspected carcinogens (Guide to Less Toxic Products). All perfumes contain toluene, which can cause damage to a developing fetus and liver, kidney and brain damage as well (Guide to Less Toxic Products). Another problem with fragrance is that it is not always fully labeled (Skin Deep: Cosmetic Safety Database). Fragrance also often contains phthalates, which are hormone-disrupting chemicals that may cause obesity, and reproductive and

developmental harm (National Geographic). One study found that at current levels, diethyl phthalate (DEP) is damaging to the DNA of men's sperm, which can lead to infertility and may be linked to miscarriages, birth defects, infertility and cancer in offspring (SISEL). The best way to avoid phthalates is to buy phthalate-free products (like some Burt's Bees products) or essential-oil fragrances instead.

6.2.vii Lead and Mercury

Lead is prohibited by Health Canada, but still remains as an impurity in four ingredients: aluminum starch octenylsuccinate, hydrogenated cottonseed oil, sodium hexametaphosphate, and hydrogenated cottonseed glyceride (Skin Deep: Cosmetic Safety Database). There are almost 600 products on The Environmental Working Group's Skin Deep: Cosmetic Safety Database that list one of these ingredients and many of them are products from popular brands, like some Neutrogena and some AVON products. Lead acetate is another dangerous form of lead and is frequently found in some of the Grecian brand hair dyes for men (Skin Deep: Cosmetic Safety Database). Lead is a known carcinogenic and hormone disrupter (Guide to Less Toxic Products). It is easily absorbed through the skin and accumulates on the bones (Guide to Less Toxic Products).

Mercury is also prohibited because of strong links to human neurotoxicities (National Geographic). According to The Environmental Working Group's Skin Deep: Cosmetic Safety Database there are only three products that contain it in its pure form, and in small amounts, but like lead, it is a common impurity in hydrogenated cottonseed oil and hydrogenated cottonseed glyceride (Skin Deep: Cosmetic Safety Database).

6.2.viii Parabens (methyl-, propyl-, butyl-, ethyl-, Isobutyl-)

Parabens are preservatives in a very large number of PCPs that are often affect the endocrine system, which are the glands that produce hormones (Greener Choices). They also cause allergic reactions in some people (Guide to Less Toxic Products). Look for products that advertise that they are paraben free (like many Burt's Bees products).

6.2.ix Petroleum distillates

These possible human carcinogens are found in many types of mascara and some corn, callus, or wart treatments (Skin Deep: Cosmetic Safety Database). Derived from petroleum, they also have a very large environmental impact. They may also be listed as

stoddard solvent; light liquid paraffin; petroleum distillate; petroleum (Skin Deep: Cosmetic Safety Database).

6.2.x p-Phenylenediamine (PPD)

P-Phenylenediamine is a known human respiratory toxin and a known human immune system toxin (Skin Deep: Cosmetic Safety Database). It can be found in over 700 types of hair dye (Skin Deep: Cosmetic Safety Database), and usually in the darker colours. It is also a carcinogen (Guide to Less Toxic Products).

6.2.xi Sodium Lauryl Sulfate, Sodium Laureth Sulfate

A lathering agent currently found in approximately ninety percent of shampoos as well as some soaps and toothpaste that can be a skin irritant and is at high risk of 1,4-dioxane impurities (Guide to Less Toxic Products).

6.2.xii Talc

Talc can be a carcinogenic when inhaled. Women who use talc on the genital area have an increased risk of ovarian cancer. Talc is also a respiratory irritant. (Guide to Less Toxic Products)

6.3 Health Canada Guidelines

The Consumer Product Safety Bureau of Health Canada created *The Cosmetic Ingredient "Hotlist"* which is a list of ingredients which are prohibited or restricted for use in cosmetics. The entire list can be found at http://www.hc-sc.gc.ca/cps-spc/person/cosmet/info-ind-prof/_hot-list-critique/hotlist-liste_e.html. The list is intended as a way to keep the cosmetic industry aware of new substances of concern. The list also helps to inform producers about ways they may be violating section 16 of the Food and Drug Act which states that, "no person shall sell a cosmetic product that has in it any substance that may injure the health of the user when the cosmetic is used according to its customary method (Health Canada)." I was looking at the list of ingredients and I saw many ingredients that I recognized and I assumed it was safe to believe that the products that had these ingredients were following the restrictions indicated on *The Cosmetic Ingredient "Hotlist"*. However, I got to the ingredient talc, one which I immediately recognized and understood the implications of and the restriction said, "The inner label and the outer label of baby powder products shall carry cautionary statements to the effect: "Keep out of reach of children, and keep powder away from child's face to avoid

inhalation which can cause breathing problems.” (Health Canada). As you can see in Figure 6.2, there are no precautionary warnings to be found on this particular brand of baby powder, and it was even made in Canada! This is very unsettling because if standards are not always up held on baby products, I fear the situation may be even worse with other products, and many of the ingredients on *The Cosmetic Ingredient “Hotlist”* are a lot more dangerous than talc.

Figure 6.2 Lander's Baby Powder
Image of baby powder found in my home that does not follow the Health Canada guidelines by having a precautionary label.

There are many webpage's that I have read that complain about the government's lack of initiative in creating any standards in regards to cosmetic ingredients, and truth be told, more could be done in terms of prohibiting certain ingredients from being used. But Health Canada has made a clear effort to create comprehensible standards and for some reason or another they are being ignored. However, it is not quite clear how these things are governed. It seems as though it is up to individuals to catch a company disregarding *The Cosmetic Ingredient “Hotlist”*. In the following quotation from the Health Canada website you will see why I feel this way:

If a cosmetic contains an ingredient which appears on the Hotlist, the manufacturer may be advised to:

- Remove the substance from the formulation;*
- Reduce the concentration of the ingredient to an acceptable level;*
- Consider marketing the product as a drug, with appropriate claims and apply for a Drug Identification Number (DIN);*
- Provide evidence that the product is safe for its intended use;*
- Confirm that the product is labeled as required;*
- Confirm that the product is sold in a child-resistant package.*

Depending on the response of the manufacturer, the cosmetic may be found to be unacceptable for sale in Canada. In such a case, the product would be:

- Referred to a regional Product Safety Officer for appropriate action;*
- Referred to the Health Products and Food Branch (HPFB) Inspectorate.*

The quotation does not say who is to inspect the product, but obviously not all products are inspected, or inspected with the same level of concern. It would be interesting to have a look and see if any other products can be found that violate the terms of Health Canada. It would also be interesting to phone them and see if they are going to take any action.

7.0 Chapter Seven - Discussion

The major findings of this study include the realization that there truly are many harmful, or potentially harmful products available to consumers in the form of personal care products. On the other hand, there truly are many alternatives available. What I find most interesting however is that these alternatives are available at a reasonable price and can be found in places other than health food stores.

What this means is that, as far as Peterborough Green-Ups job goes with educating the public, they may have a better response if they let everyday consumers, not just ethical consumers, know that there are reasons to seek these alternative products, not only for the environment, but because these products are harming our bodies and the bodies of our friends and loved ones, and there is a cheaper solution in many cases. The importance of this relates back to the notion that Eriksson presents, which is that there might be an alternative to green regulations via green consumerism. This study also revealed a list of ingredients to try to avoid which is very useful as information to put on the Green Shopping Guide. The information that I found was scattered all over the internet and in academic journals and I think it will be an important tool for community members to have available and to use.

The data could also be interpreted as inconclusive and the fact that government policies do exist around such issues can give the impression that products are regulated and there is no proven cause for concern. However, I would have to argue that as demonstrated in section 6.3, guidelines are provided and not always followed. This should cause enough suspicion to warrant some truth in the information that I have gathered.

Some may also find it problematic that I am holding Wal-Mart in such high regard when it is known that Wal-Mart is not the most ecologically sustainable form of retail. However, I feel that it depends on the goal of the education. For me, I would want to see as many people involved as possible because there is power in numbers. Peterborough Green-Up, or others, might feel that the cons of a store like Wal-Mart outweigh any sort of benefit that may have been gained from the increase in participants. Therefore, the data and my recommendations may not be ideal for everyone.

This study is limited by a number of things. Most importantly, I would say that it is limited because the majority of research is toxicological in nature and I am a Geography major. To compensate for this, I have had to rely on less scientific literature so that I could make sense of it. And those pieces that are more scientific may have been interpreted wrongly in some cases. In the end, the study could benefit from some more scientific research; however, I do not feel that the integrity of this report has been jeopardized in any great length for not having research that is more scientific.

Another limitation was my inability to find a lot of environmental literature linked to the production and proper disposal of PCPs. I present a very basic explanation of the process and revert to a concept that Peterborough Green-Up created, or at the very least, already implements, as you will see in the next section.

Physical and time restraints were also a problem with completing this report. Having selected a less than superior methodology in the beginning, a lot of time was wasted and there was not enough time at the end to complete the report the way that I would have liked to. Also, having a partner *may* have made the research process a little easier. It was also very difficult to grasp the infinite amount of information that was available to me. I should have had a very detailed plan from the beginning of what I would research. The research questions required very little exploration of the issues associated with PCPs, but having to make it into a report dictated the necessity to broaden the questions. The result is a mish-mash of very interesting, very condensed topics. Perhaps if I made myself more available to meet with Peterborough Green-Up staff, or class supervisors, they could have directed me as to what directions are the most interesting to follow.

This study also lacks some sort of human contact aspect. Looking back, perhaps a survey or some interviews could have been interesting and may have provided more information as to the potential usefulness of this information. For instance, interviewing Wal-Mart customers about the products they buy and the reasons for it. Having focus groups and explaining the information I have found and gauging reactions to determine whether this information will in fact be beneficial to the community, would have also been useful.

I have not been able to produce the perfect recommendations for products because many of my sources did not overlap. For instance, some of the products in the charts that were

found in local stores contain some of the ingredients that I suggest to avoid. This is because the information I used for the charts ([Skin Deep: Cosmetic Safety Database](#)) considered that the amount of the toxic ingredients included in the product did not amount to very much. My recommendations are not entirely useless however, they demonstrate the complexities of the industry and should still be implemented as there is still some merit in the suggestions as they have been suggested by other researchers with more toxicological experience than me.

Another limitation, which links in with suggestions for further research is that there really is not much conclusive evidence. Words like "may," "could," "potential," "possible," and "believed" are used frequently in this report and that is because they are used frequently in many other reports. Advancements are being made; I just think there needs to be more support behind it so that we can *know* what is happening to our bodies and environment.

The environmental impact of these PCPs needs to be researched further. One persons use of a toxic ingredient does not just affect their body, it affects all of our bodies through the water we drink and the environment we live in; we need to understand the implications of these actions.

More research into consumerism could also be beneficial. If Peterborough Green-Up, and organizations like it, knew what type of people they are targeting, they may be able to better accommodate the educational needs of that group. If I knew what type of people this research was to be catered for, I may have made different recommendations instead of instilling my own beliefs about what needs to be done.

Overall I am quite satisfied with the findings of this research. I truly learned a lot. Changing my methodology near the end, although it really made timelines impossible to commit to, really paid off because it gave me the opportunity to research more than the original seven products that I had intended to focus on. This inevitably gave Peterborough Green-Up more research and even though my original method would have been physically more work which would have perhaps demonstrated more effort, using the Environmental Working Group's [Skin Deep: Cosmetic Safety Database](#) provided me with more information than I could have gathered standing in a store, and it provided more accurate and scientific research. Using a source with such well-documented references allowed me to be rigorous in research.

8.0 Chapter Eight - Recommendations

8.1 The Five R's

My recommendations will focus around Peterborough Green-Ups notion of the five R's, RETHINK, REFUSE, REUSE, REDUCE, And RECYCLE. Focusing recommendations around this concept will hopefully aid in the education process by making it easy to understand and remember.

RE(THINK)...

...about whether the product is a necessity, if it is not, you probably should not buy it.

...about where your products come from. Buy locally to support your community and to reduce greenhouse gas emissions.

...about product lifecycle analysis – how is it made, how does it get here, where does it go, is it reused?

...about buying products that are solid waste so that you can better control where they go instead of possibly contaminating our drinking water.

REFUSE...

...to buy any products containing any of the *12 toxic ingredient types*:

1. Antibacterials (triclosan, triclocarban)
2. Coal tar colours: FD&C Blue 1, Green 3
3. Diethanolamine (DEA) (or Cocamide DEA, MEA, and TEA for that matter)
4. 1,4-Dioxane ("PEG," "-xynol," "cetareth," "oleth" and most other "eth" types)
5. Formaldehyde (diazolidinyl urea, DMDM hydantoin, imidazolidinyl urea, quaternium-15, sodium hydroxymethylglycinate, 2-bromo-2-nitropropane-1,3-diol, polyoxymethylene urea, methenamine, 5-bromo-5-nitro-1,3 dioxane, and glyoxal)
6. Fragrance (or parfum, DEP, or phalates)
7. Lead and Mercury (aluminum starch octenylsuccinate, hydrogenated cottonseed oil, sodium hexametaphosphate, and hydrogenated cottonseed glyceride)
8. Parabens (methyl-, propyl-, butyl-, ethyl-, Isobutyl-)
9. Petroleum distillates (stoddard solvent; light liquid paraffin, and any other word with petroleum in it)
10. p-Phenylenediamine (PPD)

11. Sodium Lauryl Sulfate, Sodium Laureth Sulfate

12. Talc

...to buy aerosol containers

...to buy scented products. They are often full of harmful chemicals and many people are allergic to them.

...to buy products with non-biodegradable ingredients

...excess packaging – don't buy the product, or leave the packaging at the store with the manager.

REUSE...

...your plastic bags or bring your own bags when you go shopping

...packaging and use it for storage, make crafts with your children, or donate clean containers to children's craft groups or schools if they will accept them.

REDUCE...

...your amount of waste and your spending by buying in bulk or in concentrate

...the amount of product that you use

...the amount of waste and buy post-consumer recycled products

RECYCLE...

...ONLY AS A LAST RESORT!

Figure 8.1 *Post-consumer recycled material symbol*
Percentage number in the centre represents the amount that it contains.

8.2 The Least Toxic Options in the City of Peterborough

Table 8.1 *Top recommended products and locations to get the products*
 Note that this chart, like others, may be missing information about the *best* products, as they may not have been listed on cosmeticdatabase.com or on store shelves at the time.

Product Type	Recommended Source
Acne Treatments	Thursday Plantation 100% Pure Tea Tree Oil \$14.06 / 25mL @ Wal-Mart
Bar Soap	Kiss my Face Bar Soap, Pure Olive Oil, Fragrance-Free \$2.53 / 113g @ Wal-Mart
Body Wash	Check JoAnne's Place for a brand on the list in appendix A, or Cetaphil Gentle Skin Cleanser \$15.32 / 500mL @ Wal-Mart
Contact Lenses Solution	Boston Advance Cleaner \$7.77 / 30mL @ Wal-Mart
Deodorant / Antiperspirant	Crystal Body Deodorant Spray Mist \$3.99 / 100ml. @ Shoppers Drug Mart
Depilatory's	Parissa Quick & Easy 2-in-1 Roll-On Legs, Face & Bikini \$10.46 (large kit) @ Wal-Mart
Hair Dye	Sun-In Super Steaks Highlighting Gel (Spray with Lemon) \$4.93 / 138mL @ Wal-Mart
Hairspray	Got2b Glued Spiking Freeze Spray Aerosol, Spike, cement finish \$5.47 / 400mL @ Wal-Mart (note: this is an aerosol, consider next option) Got2b Glued Rubber Spiking Cement, spike, manipulate, control \$5.47 / 175mL also @ Wal-Mart
Lip Balm	Check JoAnne's Place for a brand on the list in appendix A, or ChapStick Lip Moisture Conditioning Lip Balm \$1.67 / 4.2g @ Wal-Mart
Moisturizer	Check JoAnne's Place for a brand on the list in appendix A, or Desert Essence Tea Tree Oil Skin Ointment \$6.99 / 30mL @ The Maine Ingredient (as Petroleum Jelly should probably be avoided), or the local Farmers' Market!
Nail Polish	Revlon Liquid Quick Dry (Basecoat) \$6.58 / 9.41mL @ Wal-Mart
Shampoo	Burt's Bees Grapefruit & Sugar Beet Shampoo \$9.99 / 354mL @ Shoppers Drug Mart
Shaving Cream (Women's)	Check JoAnne's Place for a brand on the list in appendix A, or Schick Intuition Plus Razor Cartridge, Sensitive Skin \$19.66 / 6 cartridges @ Wal-Mart
Teeth Whitening	Use a Tom's of Maine Tooth Whitening Toothpaste (available cheapest at Wal-Mart), or Crest Whitestrips Renewal Age Defying Strips (plus 2 bottles of VIVID White Toothpaste) \$34.96 / 10 days also @ Wal-Mart
Toothpaste	Tom's of Maine Natural Baking Soda Toothpaste with Propolis & Myrrh, Peppermint \$4.48 / 85mL @ Wal-Mart

8.3 Solutions for Other Types of Products

Head Lice Removal

The best way is always a comb and a patient set of hands. However, it can also be treated safely with tea tree oil which is available at JoAnne's Place, Shoppers Drug Mart, and Wal-Mart, as well as many other stores.

Fragrance / Body Spray

If you feel the desire to wear scent, use essential oils (found at places such as JoAnne's Place). There is a very wide variety of pleasant scents available.

Etcetera

Take note of websites and books that offer homemade solutions. www.makeyourcosmetics.com is an excellent source for alternative PCPs and the recipes are not too extreme and many look quite intriguing.

If ever in doubt, brands that tend to be ideal alternatives to many of the toxic ones you can find in the store include:

JASON Natural Cosmetics

Aubrey Organics

Tom's of Maine

Burt's Bees

Aveda

Kiss my Face

9.0 Chapter Nine - Summary and Conclusions

The research I have presented is critical. It is critical to the development of the field and is critical to every single person in the Peterborough area and beyond. This paper identifies the reasons why this information and studies like it are critical to people who want clean air and clean drinking water, people who want to live a healthier lifestyle, people with chemical sensitivities, people whose workplace has gone scent free, asthmatics and others allergic to synthetic scents, and friends and family of all these types of people. With this information, many of these people can impact the quality of their life and the lives around them.

All of the things I spoke about are very intricately related. All of the environmental effects are directly related to our use of these products. Learning about the human toxicological effects will hopefully impact our use of the products and will either reduce or eliminate use altogether. As demonstrated by Table 3.1, our use of these chemical products directly influences the production and sales of the waste that they produce. So again, reducing or eliminating our need will effect the environmental impact of the overall waste of these products. Geographically, as seen in Clapps article, our waste has become an ethical issue; where do we find room for it all? The ethics aspect of environmental waste has even become an issue in Canada as well. Some people and organizations are trying to make a difference, but as previously mentioned, we are struggling to get anything accomplished because all of the people and organizations have their own ideas and nothing is linking together, not within the groups, or within Canadian politics.

The results that I produced from the local survey of products lead me to recommend going to Wal-Mart to buy many of these safer products. However, as mentioned, there is a lot of controversy surrounding Wal-Mart and ethical shoppers, as described by Wheale and Hinton, might object to that sort of thing. This is why I suggest JoAnne's Place and note that they have, or can get, pretty much any of the products you are looking for. And as mentioned, there is always the option of making your own products.

Taken as a whole, I am pleased with the results of this research. I answered the questions posed by Peterborough Green-Up in the best ways I could and feel that I have even provided them with more information than needed. My report covers the basis of a very wide assortment of topics and provides the average reader with all of the information they need to

begin a less toxic lifestyle. This information, along with other information already available on The Green Shopping Guide, is a good foundation to aid in the process of public education.
